

Technical English Translation

This application has been developed for the preparation of consultants' invoices in accordance with the current national regulations and is currently under testing.

In support of the domestic software development industry, the application has been designed in such a way that its full use is available only during the current year and in a limited manner.

The full feature set, including comprehensive reports in Word, Excel, and PDF, is available.

If you identify any defects or shortcomings in this application, please share them with us:

vmirsadraee2195@gmail.com

The application has the following features and capabilities:

- The front end has been developed using React.
 - The back end has been developed using FastAPI.
 - The application includes an SQLite database which, for security reasons, operates in a one-way manner. In other words, the data is read-only. Depending on the owner's security requirements, it is possible to implement data storage in local databases and internet-based services. Under conditions of low network security, this programming architecture minimizes the likelihood of cyberattacks. In summary, all operational processing is performed on the front-end side, and no data is stored; therefore, access to the server side is limited.
 - Various buttons, color schemes, and numerous fonts have been used in the design of the application pages, all of which can ultimately be customized according to the client's preferences.
 - A set of reports in Word and Excel formats has been incorporated into the application to demonstrate its capabilities.
-

User Guide

First, visit the website:

<https://consultant2-v2.vercel.app>

The services of this website are free of charge, and downloading the application may take some time.

Create a new project or download your previous projects. For beginner users, a sample project is provided. Download it and use it for familiarization.

1. New Project

First, select the circular/instruction year corresponding to the contract signing year. In the current version of the application, only the years 1403 and 1404 are active, although additional years can be added.

Then click the New Project button. You will be asked whether the previous information should be cleared; click Yes. The tables related to the selected circular will then be installed.

2. Download Previous Projects

The application always keeps the user's latest active project in the browser memory. If you have multiple projects, or if other users have sent you a project file, click the Select File button and load the project file, which is in JSON format.

3. Enter Contract Information

Next, go to the Basic Information page and enter your contract details. Please ensure that the project coefficients are entered correctly; otherwise, the final output data will not be valid or reliable.

If you wish to clear all information on the page and re-enter it, click the New Page button. Then proceed to the next step.

4. Supervision Services Before Execution

The services in this section include those performed prior to contract execution and are divided into two main parts:

1. items with mandatory prices defined by the circular, and
2. fields whose prices are subject to agreement and are negotiated during contract signing.

In this section, some price fields are left blank and the agreed prices must be entered manually. Therefore, first click on the desired row, then click Edit Price, and enter the relevant amount.

You may also add a completely new row outside the circular structure to include special services not covered by the circular. To do so, go to Add New Row, enter the row details, and save them. A new row will be added at the end of the table.

These rows may also be deleted, and it is also possible to restore all page data to its initial state.

After the initial setup of the page, you may select the fee-related rows, select all rows, or deselect them. The total fee for this section is displayed in the upper-right corner. After completing this step, proceed to the next section.

5. Supervision During Execution

At this stage, proceed in the same manner as in the Supervision Before Execution section, but for the services rendered during execution, and then move to the next step.

6. Case-Based Supervision and Post-Execution Supervision

Complete the Case-Based Supervision Services and Post-Execution Supervision Services pages in the same manner as the previous sections.

7. Site Supervision Services

Go to the Site Supervision Services page. This page is initially blank.

First, introduce the resident and effective site personnel.

Add a new row.

Complete the table above in accordance with the contractual circular.

Then save the information.

You can now enter the monthly daytime and nighttime working hours for each month, and the software will automatically calculate the work performance.

Then proceed to the next step.

8. Statement of Work / Interim Payment Certificate

In the Statement of Work section, enter the contractor's work performance data.

A supporting file for calculating work performance is available for download, which can help you calculate the details. Download it and complete it in accordance with the circular. Then apply the result in the relevant page.

At the client's request, the downloadable file can be removed, and the information can be entered directly on this page.

9. Payments Page

The Payments page displays the amount payable to the consultant in the monthly supervision and site supervision sections, as well as the method of calculation.

This section is for displaying the calculation method only and does not require any user action. Therefore, after reviewing it, proceed to the next step.

10. Support Services

This section includes the services and expenses provided monthly by the consultant, such as surveying, office preparation and equipment, food, and similar items.

This section supports:

- **price modification,**
- **determination of agreed prices with the employer,**
- **adding rows,**
- **deleting rows.**

After completing this section, specify the quantity of services provided each month so that the total cost can be calculated.

11. Financial Summary

The final page contains the financial summary to be presented to the employer.

The reports generated by this application can be provided in Excel, Word, or PDF format. Since this application is currently a demonstration version, its reports are not yet fully complete. However, the calculations have final-level accuracy and are currently under testing.

In the final version, the reports requested by the client can be provided in full, with print-ready pagination and complete visual features.

At the end of the process, you may save this month's data in the desired file and send it to the employer.

(Implementation of these capabilities within the application is feasible.)

Final Notes

Finally, it should be noted that in developing this application, the demonstration of visual capabilities has been implemented in a limited yet varied manner. Therefore, the buttons are of different types, the color schemes and fonts are not yet fully unified, and there is substantial potential for visual customization according to the client's preferences.

Some features, such as Excel file download, have been included for demonstration purposes and may be removed in the final version, along with other elements that can be modified according to the client's requirements.

It is also possible to add security features, database connectivity, and payment gateway integration. However, since this application is intended as a general-purpose and auxiliary tool for consultants and public-sector employers, and does not require two-way communication, my recommendation is that, where possible, internet connectivity to information resources should remain limited in projects of this type.
